Abstract

The Smart Government Scheme Finder project is developed to address the challenge of limited awareness and accessibility of government welfare schemes among citizens. Governments introduce numerous schemes for different sections of society; however, many people face difficulties in identifying the schemes they are eligible for due to complex eligibility criteria and scattered information across multiple platforms. This project provides a centralized digital platform that simplifies the process of discovering relevant schemes by collecting essential user details such as age, income level, occupation, gender, and social category, and processing this information using a rule-based eligibility engine to recommend suitable schemes. The system ensures accurate, fast, and personalized results, reducing the need for manual searching and improving efficiency. The platform is designed with a simple and user-friendly interface, making it accessible even to users with basic digital knowledge, and includes features such as eligibility-based filtering, clear scheme information, and chatbot assistance to enhance user experience and understanding. The main objective of this project is to increase awareness, transparency, and accessibility of government welfare programs, thereby promoting inclusive development and ensuring that benefits reach the intended beneficiaries. This project aligns with the United Nations Sustainable Development Goals (SDGs), particularly SDG 9 (Industry, Innovation and Infrastructure), SDG 10 (Reduced Inequalities), and SDG 16 (Peace, Justice and Strong Institutions) by improving access, transparency, and efficiency in government services.

Keywords: Government Schemes, Scheme Recommendation System, Digital Governance, Eligibility Detection, Web-Based Application, Chatbot Integration, Google Gemini API, Database Management System.

Chapter 1

1. Introduction

In the modern digital era, governments across the world are increasingly adopting advanced technologies to improve the delivery of public services and ensure transparency, efficiency, and accessibility. Governments introduce a wide range of welfare schemes every year to support different sections of society such as students, farmers, women, unemployed individuals, senior citizens, and economically weaker groups. These schemes aim to provide benefits such as financial assistance, healthcare support, education opportunities, employment generation, housing facilities, and social security.

However, despite the availability of these beneficial initiatives, a large number of citizens remain unaware of them or face difficulties in accessing them. This gap between government initiatives and actual beneficiaries leads to underutilization of resources and limits the overall impact of these welfare programs.

1.1 Proposed Solution: Smart Government Scheme Finder

To address these challenges, the Smart Government Scheme Finder project is proposed as an innovative and efficient solution. The system provides a centralized digital platform that simplifies the process of discovering government schemes.

The system allows users to enter basic personal details such as:

- Age
- Income level
- Occupation
- Gender
- Social category

Based on this information, the system processes the data and recommends suitable government schemes using a structured database and filtering mechanism. This automated approach eliminates the need for manual searching and ensures that users receive accurate and relevant scheme recommendations quickly.

1.2 Key Features of the System

The Smart Government Scheme Finder platform includes several important features:

- Centralized Scheme Database: All schemes are stored in a structured database for easy access.
- Eligibility-Based Recommendations: The system filters schemes based on user details.
- User-Friendly Interface: Simple and intuitive design suitable for non-technical users.
- Clear Scheme Information: Displays eligibility criteria, benefits, and application process clearly.
- Chatbot Assistance: An intelligent chatbot helps users understand schemes and resolve confusion.

These features improve accessibility and ensure that users can easily find relevant schemes.

1.3 Importance of the System

The implementation of this system contributes to digital empowerment and inclusive development. By providing a single platform for accessing multiple schemes, the system bridges the gap between citizens and government services.

Key benefits include:

- Increasing awareness of government welfare schemes.
- Ensuring that benefits reach the intended beneficiaries.
- Reducing dependency on middlemen and unofficial information sources.
- Improving transparency and trust in government services.

This is particularly important in developing regions where awareness and accessibility remain major challenges.

Chapter 2

2. Literature Survey/Existing System

2.1 The Problem of Information Asymmetry

One of the major challenges in implementing government welfare schemes is information asymmetry, which occurs when information about schemes exists but citizens are unaware of it. Governments introduce numerous welfare schemes every year to support various sections of society such as students, farmers, women, and economically weaker groups. However, many eligible beneficiaries fail to receive these benefits due to lack of awareness and difficulty accessing accurate information. In many cases, information about schemes is scattered across different websites, government portals, and offline sources, which makes the process of searching for suitable schemes time-consuming and confusing.

This problem is more serious in rural and semi-urban areas where internet access and digital literacy are limited. Many citizens depend on middlemen or unofficial sources for scheme information, which can sometimes lead to misinformation or exploitation. As a result, even well-designed government welfare programs fail to reach the people who need them the most.

Therefore, there is a strong need for a centralized and user-friendly system that can provide clear, structured, and easily accessible information about government schemes.

2.2 Existing Government Scheme Platforms

Several online platforms currently provide information about government schemes. One of the major examples is the myScheme portal, which offers a centralized database of schemes from different government departments. These platforms help users search for schemes based on categories, keywords, or filters.

However, most existing systems still require users to manually explore scheme details and compare eligibility criteria with their personal information. This process can be complex and time-consuming, especially for individuals who are not familiar with digital platforms. In addition, many government portals present scheme information in a text-heavy format, which makes it difficult for users to quickly understand the benefits and eligibility requirements. These limitations highlight the need for more intelligent and user-friendly systems that can simplify the process of discovering suitable schemes.

2.3 The Role of Smart Technology

Advancements in Artificial Intelligence (AI) and Machine Learning (ML) have significantly improved the efficiency of digital platforms. These technologies are widely used in recommendation systems, where user data is analyzed to generate personalized suggestions. Popular digital platforms such as streaming services and e-commerce websites use recommendation systems to suggest relevant content or products to users based on their preferences.

A similar concept can be applied to government scheme platforms. By collecting basic user information such as age, income level, occupation, and category, a system can automatically match the user profile with scheme eligibility criteria stored in a database. This approach can reduce the effort required by users to manually search for schemes and improve the accuracy of recommendations. Additionally, technologies such as chatbots can enhance user interaction by providing guidance and answering queries in a conversational manner. Integrating such technologies can transform traditional information portals into more efficient and user-friendly systems.

2.4 Comparative Analysis of Existing Systems

Table 2.1: Comparative Analysis of Government Scheme Platforms

Features / Criteria	**myScheme (Govt Portal)**	**Local NGO Portals**	**Smart Government Scheme Finder (Proposed)**
Search Method	Keyword / Filter based	Manual listing	Smart filtering
Eligibility Check	Basic form input	Not available	Automated profile matching
User Interface	Text-heavy	Simple but limited	User-friendly interface
Language Support	Limited	Single language	Basic English interface
Personalization	Low	None	High (based on user data)
Accessibility	Moderate	Limited	High
Technology Used	Static web system	Basic systems	AI-assisted intelligent system

The table above compares existing government scheme platforms with the proposed system. It shows that most existing systems rely on manual searching methods and provide limited personalization. The proposed system aims to improve this by introducing intelligent filtering and automated eligibility matching.

2.5 Research Gap

Based on the literature review and analysis of existing systems, several limitations can be identified. Although platforms such as the myScheme portal provide centralized access to government schemes, they still lack advanced recommendation capabilities and user-friendly interaction mechanisms.

Most existing systems require users to manually search and filter information, which can be difficult for individuals with limited technical knowledge. These platforms also do not

effectively utilize modern technologies such as Artificial Intelligence or chatbot-based interaction to simplify the process.

Another limitation is the lack of personalized systems that automatically match user profiles with relevant government schemes. Without personalization, users may need to spend a significant amount of time identifying suitable schemes.

Therefore, there is a need for a smart and intelligent system that can simplify the process of discovering government schemes and provide personalized recommendations to users.

2.6 Summary

The literature review shows that although information about government welfare schemes is available through different portals, many existing systems lack personalization, intelligent assistance, and easy-to-use interfaces. Users often need to manually search through large amounts of information, which can be confusing and time-consuming.

The proposed Smart Government Scheme Finder aims to overcome these limitations by developing an intelligent system that can match user profiles with relevant schemes. By integrating modern web technologies and intelligent filtering mechanisms, the system provides a simple, efficient, and accessible platform for citizens to discover government schemes.

Chapter 3

3. Limitation of Existing system

3.1 Limitations of Current Systems

Government portals and platforms developed to provide information about welfare schemes still face several limitations that reduce their effectiveness. One major issue is the lack of a centralized and user-friendly interface, as scheme information is often scattered across multiple websites, applications, and offline sources such as government offices. Users are required to manually search through different platforms to find relevant schemes, which is time-consuming and often confusing. This process becomes even more difficult for individuals with limited technical knowledge or digital experience.

Another important limitation is the absence of personalization. Most existing systems provide only general information without considering individual user profiles. Users must manually compare their personal details with the eligibility criteria of each scheme, which increases effort and may result in missing suitable opportunities. In addition, many platforms are text-

heavy and contain complex language, making it difficult for users with low digital literacy to understand scheme details and application procedures.

Furthermore, many existing platforms lack real-time updates, integration between systems, and interactive guidance. In some cases, outdated or incomplete information may be displayed, which can mislead users. These systems also lack interactive support such as chatbots or guided assistance that could help users navigate the platform easily. These limitations highlight the need for a more intelligent, user-friendly, and accessible system that can simplify the process of discovering and understanding government schemes.

3.2 Challenges in Accessibility and Usability

Accessibility and usability remain major challenges in existing systems. Many users are not familiar with digital platforms and may find it difficult to navigate through complex interfaces. The absence of simple and intuitive designs reduces user engagement and limits the effectiveness of these platforms. In addition, language barriers prevent many users from understanding scheme details, as most information is provided in limited languages.

Another challenge is the dependency on manual processes. Users are required to read through large amounts of information and make decisions based on their understanding. This increases the chances of errors and confusion. Moreover, the lack of awareness about available schemes further reduces participation, especially among rural and economically weaker sections of society.

3.3 Research Gap

Based on the analysis of existing systems, a clear research gap can be identified. Most current platforms focus on providing information rather than delivering personalized and intelligent services. There is a lack of systems that can automatically match user profiles with relevant government schemes. Existing solutions do not effectively utilize modern technologies such as Artificial Intelligence, Machine Learning, or intelligent recommendation systems.

Additionally, there is limited use of interactive features such as chatbots or voice-based systems that can guide users in a simple and user-friendly manner. Multilingual support is also insufficient, which affects accessibility for a large population.

Therefore, there is a need for a smart and efficient system that overcomes these limitations by providing personalized recommendations, simplified interfaces, and improved accessibility. The proposed Smart Government Scheme Finder aims to address this gap by offering an

intelligent platform that connects users with suitable government schemes quickly and accurately, ensuring better utilization of available resources.

Table 3.1: Limitations of Existing System

Aspect	Existing System Issue
Interface	Not user-friendly, complex navigation
Personalization	No customized scheme recommendations
Accessibility	Limited language support
Data Handling	Scattered and unorganized information
Updates	Lack of real-time updates
User Support	No chatbot or guidance system

Chapter 4

4. Problem Statement and Objectives

4.1 Problem Statement

In the current scenario, a large number of government welfare schemes are available for different sections of society. However, many eligible citizens are unable to benefit from these schemes due to lack of awareness, scattered information, and complex eligibility criteria. Existing platforms provide general information but require users to manually search and filter schemes, which is time-consuming and confusing.

Additionally, the absence of personalized recommendations makes it difficult for users to identify schemes that are relevant to their specific needs. Many platforms are text-heavy and not user-friendly, which creates challenges for individuals with limited technical knowledge. Language barriers and lack of interactive support further reduce accessibility, especially for users from rural or non-technical backgrounds.

Therefore, there is a need for an intelligent and user-friendly system that can simplify the process of discovering government schemes by providing personalized recommendations based on user data. The system should be efficient, accessible, and easy to use for all categories of users.

4.2 Objectives of the Project

The main objective of the Smart Government Scheme Finder is to develop an efficient system that helps users easily identify suitable government schemes based on their eligibility. The specific objectives of the project are as follows:

- To design and develop a centralized platform for accessing government schemes.
- To provide personalized scheme recommendations based on user details such as age, income, occupation, and category.
- To reduce the time and effort required for searching and filtering schemes manually.
- To improve awareness and accessibility of government welfare programs among citizens.
- To develop a simple and user-friendly interface for easy navigation.
- To ensure accurate and relevant information delivery using a structured database.
- To enhance user experience by simplifying the process of scheme discovery.
- To promote digital empowerment and inclusive growth through better access to services.

4.3 Scope of the Project

The scope of the Smart Government Scheme Finder includes providing a centralized system for identifying and accessing government schemes. The system focuses on collecting user input and matching it with stored scheme data to generate relevant results. It covers various categories such as education, healthcare, employment, agriculture, and financial assistance.

The project can be further expanded by integrating advanced technologies such as Artificial Intelligence and Machine Learning to improve recommendation accuracy. Additional features such as multilingual support, mobile application development, and real-time updates from government portals can enhance the system's effectiveness and reach.

Chapter 5

5.Proposed System

5.1 Analysis / Framework / Algorithm

The proposed system is a rule-based smart recommendation framework designed to help users identify suitable government schemes based on their personal details. The system collects demographic information such as age, income, occupation, category, and location from the user. This data is processed using an Eligibility Engine, which applies predefined eligibility rules stored in the database.

The main objective of the framework is to automatically match user information with scheme eligibility criteria and provide accurate recommendations. By automating the filtering process, the system reduces manual searching and improves accessibility to government welfare programs.

The algorithm of the system works in three main steps:

1. Input Processing – The system captures user details and performs validation to ensure that the data entered is accurate and complete.

2. Rule Matching – The user information is compared with the eligibility criteria of various schemes stored in the database.
3. Filtering and Ranking – Only the schemes that match the user's eligibility are displayed, along with a clear explanation of why the user qualifies for them.

This structured framework ensures accurate, fast, and transparent recommendations, enabling users to easily discover relevant government schemes.

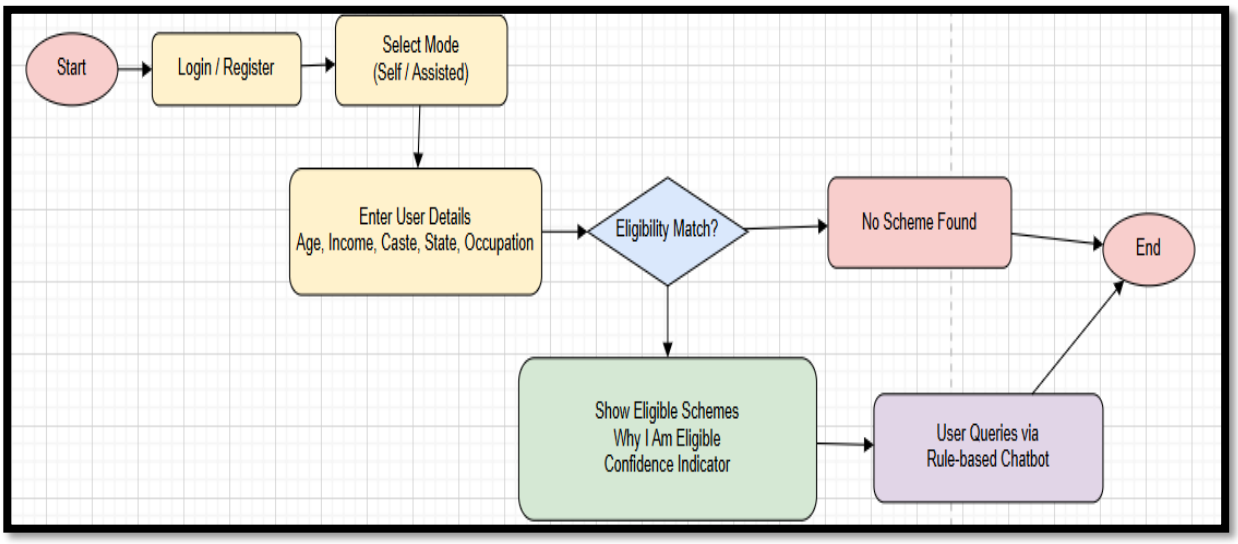

Figure 5.1: System Workflow of Smart Government Scheme Finder

The system workflow begins when the user logs into the platform and selects either Self Mode or Assisted Mode. The user then enters personal details such as age, income, caste, state, and occupation. The system processes this information through the eligibility engine to determine whether the user qualifies for available government schemes. If no schemes match the eligibility criteria, the system displays a "No Scheme Found" message. If eligible schemes are found, the platform displays relevant schemes along with explanations such as "Why Am I Eligible" and a confidence indicator. Users can further interact with the chatbot module to clarify doubts or understand scheme details. This workflow ensures a simple and efficient process for discovering suitable government schemes.

5.2 Design Details

The proposed system follows a modular architecture, where different components work together to deliver scheme recommendations efficiently. The major modules of the system are:

- User Module – Allows users to enter their personal details and view recommended schemes.

- Admin Module – Enables administrators to manage scheme data, update information, and modify eligibility rules.
- Database (MySQL) – Stores all scheme information, eligibility criteria, and user data securely.
- Eligibility Engine – The core logic that applies rule-based filtering to determine which schemes match the user profile.
- Recommendation System – Generates a list of suitable schemes based on the results of the eligibility engine.
- Chatbot Module – Assists users by answering questions about the website and government schemes.

The frontend of the system is developed using HTML, CSS, and JavaScript, providing an interactive and user-friendly interface. The backend is implemented using PHP, and the system is deployed on a XAMPP server with MySQL used for database management.

The system architecture illustrates the interaction between the frontend, backend, database, eligibility engine, and chatbot module. It shows how user requests are processed through different system components.

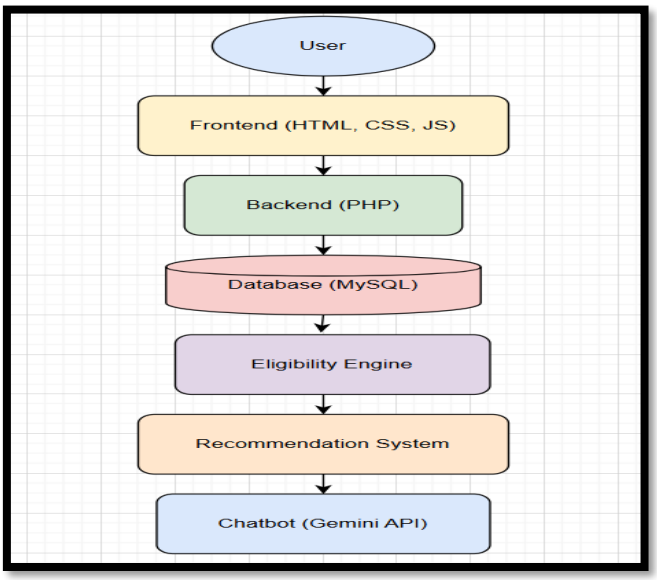

Figure 5.2: System Architecture of the Proposed System

The use case diagram shows the interaction between system users and the Smart Government Scheme Finder platform. It represents the functional requirements of the system.

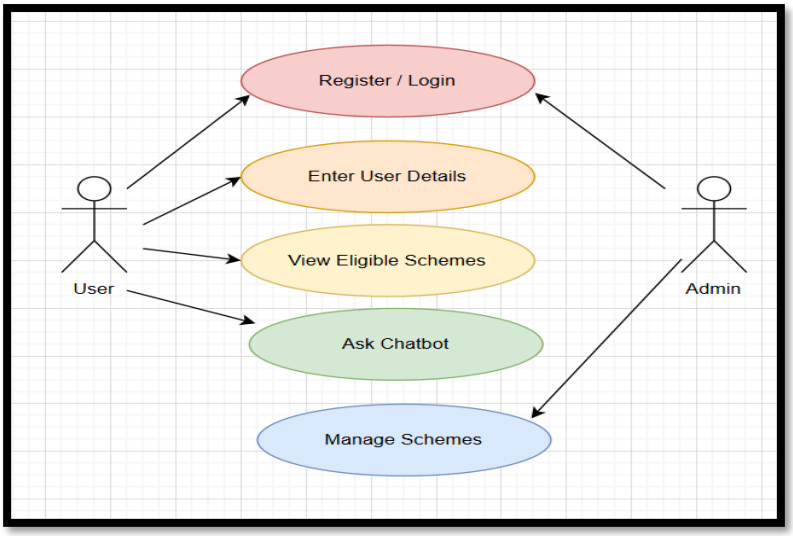

Figure 5.3: Use Case Diagram of Smart Government Scheme Finder

5.3 Methodology

The system follows a systematic approach to provide personalized scheme recommendations. The process begins when the user enters basic personal details such as age, income level, occupation, gender, and social category into the platform. The system validates the entered data and sends it to the backend server for processing. The Eligibility Engine then compares the user information with the stored eligibility criteria of various government schemes.

After processing the data, the system filters and displays only the schemes for which the user is eligible. It also provides a “Why Am I Eligible?” explanation to help users understand the eligibility conditions clearly. If users have additional questions or confusion, the chatbot module assists by providing guidance about schemes and website features.

This approach improves user experience, reduces confusion, and increases awareness of government schemes, making the system efficient and easy to use.

Chapter 6

6. Experimental Setup

6.1 Dataset / Input Details

The system uses two main types of data for generating scheme recommendations.

Scheme Dataset:

This dataset contains structured information about various government schemes such as scheme name, category, benefits, eligibility criteria, and required conditions. The data is stored in a MySQL database and is used by the system to match user eligibility with available schemes.

User Dataset (Input Data):

This dataset consists of demographic information entered by users, including age, income level, gender, caste/category, occupation, and state. These inputs help the system determine which schemes are applicable for the user.

The combination of scheme data and user input allows the system to perform eligibility matching and generate personalized scheme recommendations.

6.2 Performance Evaluation Parameters

The performance of the system is evaluated using the following parameters:

• Accuracy – Measures how correctly the system recommends schemes based on user eligibility.

• Response Time – The time taken by the system to process user input and display scheme results.

• Usability – Evaluates how easy and user-friendly the interface is for users.

• System Efficiency – Determines the system's ability to process multiple user inputs smoothly.

• User Satisfaction – Measures how helpful and clear the recommendations and explanations are for users.

6.3 Software and Hardware Setup

6.3.1 Software Requirements

- Frontend Technologies: HTML, CSS, JavaScript
- Backend Technology: PHP
- Database: MySQL
- Server Environment: XAMPP
- AI Integration: Google Gemini API for chatbot assistance

6.3.2 Hardware Requirements

- System with minimum 4 GB RAM
- Processor: Intel i3 or higher
- Basic storage capacity
- Internet connectivity

Chapter 7

7. Results and Discussion

The Smart Government Scheme Finder system demonstrated effective performance in identifying and recommending suitable government schemes to users based on their eligibility criteria. The system uses rule-based logic to match user demographic details such as age, income, occupation, social category, and location with the eligibility conditions stored in the database. Based on testing with different user profiles, the system was able to provide accurate and relevant scheme recommendations. Compared to traditional government portals where users must manually search and filter schemes, the proposed system significantly reduces the time and effort required to find suitable schemes.

The response time of the system was observed to be fast, allowing users to receive recommendations immediately after entering their details. The “Why Am I Eligible?” feature improves transparency by clearly explaining the eligibility conditions for each scheme. This helps users understand the requirements and builds trust in the recommendation process.

The integration of a chatbot module further enhances the usability of the platform. The chatbot provides guidance related to government schemes and helps users understand which scheme

may be more important to apply for when multiple schemes are available. This feature is especially helpful for non-technical users who may find it difficult to navigate complex government portals.

However, the current system relies mainly on predefined rule-based logic, which may limit scalability when handling highly complex eligibility conditions. Future improvements could include integrating advanced Artificial Intelligence techniques, automated data updates from official government portals, and enhanced recommendation models. Despite these limitations, the system successfully improves awareness, accessibility, and understanding of government schemes, thereby contributing to more efficient delivery of public welfare services.

Chapter 8

8.Conclusion and Future Work

8.1 Conclusion

The Smart Government Scheme Finder system successfully addresses the problem of lack of awareness and difficulty in accessing government welfare schemes. By using an eligibility-based filtering approach, the system provides users with accurate and personalized scheme recommendations based on their demographic details. The inclusion of features such as the "Why Am I Eligible?" explanation and chatbot assistance improves transparency and helps users understand complex eligibility criteria.

The system simplifies the process of discovering suitable government schemes and reduces the effort required for manual searching across multiple platforms. The user-friendly interface and efficient response time make the platform easy to use for individuals with different levels of technical knowledge. By providing clear and relevant recommendations, the system helps users identify schemes that match their needs.

Overall, the proposed system contributes to improving awareness and accessibility of government welfare programs. It helps bridge the gap between citizens and government services, ensuring that eligible individuals can easily identify and benefit from available schemes. This supports the broader goal of digital governance and inclusive development.

8.2 Future Scope

The system can be further improved by adding advanced features and expanding its capabilities. Some possible future enhancements include:

- AI-based recommendation system to improve the accuracy of scheme suggestions.
- Automatic scheme updates from official government portals to keep information current.
- Mobile application development to increase accessibility and usability.
- Voice-based assistance to help users who have difficulty reading or typing.
- Improved chatbot intelligence for better guidance and scheme comparison.
- Integration with official government APIs for real-time scheme data.
